

ABSTRACT

Title: DEVICE FOR AUTOMATIC CORRECTION OF THE ORIENTATION OF A MOTOR-VEHICLE HEADLAMP IN ELEVATION

Applicant: VALEO VISION

Inventors: Joël LELEVE

Philippe COUILLAUD

The present invention relates to a device for automatic correction of the orientation of at least one motor-vehicle (V) headlamp (P) upon variations in the attitude of the motor vehicle (V), including

- an emitter (1) projecting, onto the ground in front of the vehicle (V), two light spots (T_1 , T_2) which are spaced apart in a direction parallel to the longitudinal axis of the vehicle (V),
- a sensor (2) of the illumination of the light spots (T_1 , T_2) comprising an objective (3) forming an image (I_1 , I_2) of the light spots (T_1 , T_2) on a receiver (6) and supplying an output signal (dc_1 , dc_2) for each one,
- processing means (5) suitable for deriving a control signal from the output signal from the sensor (2), and
- an actuator (4) controlled by the control signal and able to alter the elevation orientation of a reflector (R) of the headlamp (P).

According to the present invention, the control signal for the actuator (4) is derived by the processing means (5) on the basis of a linear function of the output signals (dc_1 , dc_2) supplied by the sensor (2) for each image (I_1 , I_2) of each light spot (T_1 , T_2).
